

ABSTRACT

A method and system is provided for performing a network management task on a network device. The network device loads a network management application capable of performing the network management task onto the network device in response to a request. Loading may include accessing an application server having the network management application capable of performing the network management task and downloading the network management application over a network from the application server to the network device. The network device then executes the network management application corresponding to the requested network management task. Methods and systems provide a result from executing the network management application to a network management system used to manage the network.
